PCI Compliance for Retarus' Services

First service provider to be certified for both data centers and communication services

What is PCI DSS?

The Payment Card Industry Data Security Standard (PCI DSS) was implemented to help businesses process card payments securely and is supported by all of the major credit card merchants that are members of the PCI Security Standards Council. This international council was initiated by companies such as American Express, MasterCard, Discover and Visa in order to implement enhanced security standards for protecting cardholder data. There are 12 high-level requirements which have to be met in order to receive PCI DSS certification, such as data protection and security, building and maintaining a secure network, restricting and monitoring data access, and performing regular audits.

Your benefits:

Retarus' messaging services provide maximum protection of your electronic communications. Your data is protected against unauthorized access for both processing and storage. Bottom line, a PCI DSS certification is a proof of what Retarus' customers have always received and relied on: maximum security.

The award of the PCI DSS certificate for both data centers and communication services is an official proof of the highest security standards that Retarus provides its customers. This certification for both data centers and services is unique, and demonstrates the highest level of commitment to security and to provide customers of all sizes with the top tier of data protection assurance.

Who it's for:

Whether you are a start-up company or an established global player – PCI DSS is essential to any business that accepts payment by debit or credit card. Retarus' PCI DSS-certified messaging services help organizations fully comply with PCI DSS requirements when electronically transmitting payment card data. Even if you do not handle payment card data, you can still benefit from Retarus' services, as Retarus' data centers provide maximum security and protection against all unauthorized access.

PCI DSS, a "must" when processing cardholder data:

All companies that process, save or transmit account or cardholder data, are required to comply with PCI DSS guidelines. If they fail to do so, they might be charged a penalty, faced with restrictions, or banned from accepting credit cards as a form of payment. Sensitive data on payment cards include the main account number, the cardholder's name, CVV number and authentication data. Independent experts regularly audit Retarus, and other certified providers, to ensure that they continue to comply with the PCI DSS requirements.
